

## ***HummingBird™***

### **Hand-Carried Seeder/Granule Applicator**

The Dyna-Fog® HummingBird™ is designed for the application of solid materials. Granules are frequently used for the application of larvacides. It also can be used as seeding equipment, and as salt spreader.

The applicator is a shoulder-slung device. A pliable container or hopper made of water resistant cloth is fitted at its lowest point to a tube to convey the granules to the outside. A 2-way valve is located between the hopper and the discharge tube to allow the regulation of the granule output, and the shut-off at the end of the operation. The discharge tube can be disconnected from the valve and inserted it into the hopper for more compact transportation, if required.

As reference, the capacity of the hopper is 9 Lb (4.1 Kg) when *Corn Cob* based material is used. It is recommended to weigh the actual product introduced in the HummingBird to estimate the adequate dosage recommended on the product label.

In use, the discharge tube is held in the hand and is swung from side to side in a figure-eight pattern producing a remarkably even distribution of granules over a swath of up to 25 Ft (7.6 m).
